

Master of Computer Applications (MCA)

INTERNSHIP COMPLETION REPORT

Project Title: Restaurant Website

Submitted by: Abhilash K K

Department: Master of Computer Applications (MCA)

Organisation: M Squared Software & Services Pvt. Ltd.

Internship Duration: 15 June 2026 – 27 June 2026

Academic Year: 2025–2026

1. Acknowledgment

I would like to express my sincere gratitude to M Squared Software & Services Pvt. Ltd. for providing me the opportunity to work as a Web Development intern. My heartfelt thanks to my mentor and the entire team for guiding me through modern front-end development techniques and practices during the development of the Restaurant Website project.

2. Company Profile

M Squared Software & Services Pvt. Ltd. is a technology-focused company offering solutions in software development, web development, and digital transformation. The company provides practical opportunities for interns to develop real-world skills by contributing to innovative projects and client-facing products.

3. Internship Overview

As a Web Development intern, I was responsible for designing and implementing a complete multi-page restaurant website from scratch. I worked on creating responsive web pages, styling with external CSS, and adding interactive functionality using JavaScript.

Duration: 2 weeks (15 June 2026 – 27 June 2026)

Mode: On-site

Technologies Used: HTML, CSS, JavaScript

4. Project Description: Restaurant Website

The Restaurant Website is a fully responsive, multi-page static website developed for a fictional restaurant named "Food Fusion". The website is designed to provide users with an attractive and informative online presence for the restaurant, showcasing its menu, story, team, and contact details. The project was built entirely using front-end technologies — HTML5, CSS3, and JavaScript — without any backend or external frameworks.

Pages Developed:

- Home – Hero section with background image, featured dishes, why-choose-us cards, and customer reviews
- Menu – Categorised food cards with images, names, descriptions, and prices in INR
- About – Restaurant story, mission, vision, values, chef profiles, and key highlights
- Contact – Address, working hours, live real-time clock, and validated contact form

Key Features Implemented:**Responsive Navigation Bar**

A navigation bar is present on all four pages, displaying the current page title on the left and navigation links (Home, Menu, About, Contact) on the right. The links change colour to orange on hover, providing clear visual feedback. The navbar uses an HTML table layout with consistent height and padding across all pages.

Hero Section with Call-to-Action

The Home page features a full-width hero section with a background image, the restaurant name, tagline, and a short description. An orange 'Explore Menu' button redirects the user to the menu page using a JavaScript `window.location.href` call. The hero content is positioned on the left using CSS Flexbox.

Interactive Menu Page with Food Cards

The Menu page organises food items into six categories: Pizza, Burgers, Biryani, Pasta, Desserts, and Beverages — totalling 15 items. Each item is displayed as a card with a food image, name, description, price in INR, an 'Order Now' button, and an 'Add to Favourites' button. Category headings span the full grid width. Clicking 'Order Now' triggers a JavaScript alert confirming the item was added to the cart, and 'Add to Favourites' triggers an alert naming the category added.

Responsive Grid Layout

The menu grid uses CSS Grid with `grid-template-columns: repeat(3, 1fr)` on desktop screens. Media queries reduce the grid to two columns on screens below 1100px and a single column on screens below 700px. This ensures the menu remains readable and well-structured on all device sizes without any JavaScript intervention.

Contact Form with JavaScript Validation

The Contact page includes a form with fields for Full Name, Email Address, Phone Number, Subject, and Message. A JavaScript `Submit()` function validates that the Name and Email fields are not empty before allowing submission. If validation fails, an alert prompts the user to fill required fields. On success, a `confirm()` dialog asks the user to confirm, followed by a success alert. All input fields are styled to match the dark theme with an orange focus border.

Live Real-Time Clock

The Contact page displays a live digital clock that updates every second. This is implemented using JavaScript's Date object and the toLocaleTimeString() method, called repeatedly via setInterval() at 1000-millisecond intervals. The current time is injected into a paragraph element using innerHTML, giving the page a dynamic feel without any backend dependency.

Scroll-to-Top Button

All four pages include a fixed circular 'TOP' button in the bottom-right corner. It remains hidden (opacity: 0, visibility: hidden) until the user scrolls more than 300 pixels down the page. A JavaScript scroll event listener toggles a 'show' CSS class that reveals the button with a smooth CSS transition. Clicking the button calls window.scrollTo({ top: 0, behavior: 'smooth' }) to animate the page back to the top.

Consistent Footer

A uniform footer is present on all pages displaying the restaurant name in orange, the tagline 'Serving delicious memories, one plate at a time.' in italic, and a 2026 copyright notice. The footer has an orange top border and a dark background, keeping the design language consistent throughout the site.

5. Roles and Responsibilities

As the sole front-end developer for this project, I was responsible for the complete design and development of the Restaurant Website from initial planning through to a deployment-ready state. My responsibilities included:

Planning and Design:

- Analysed the project requirements and defined the content structure for each of the four pages
- Planned the visual theme — dark background with orange accent colours — for a modern, premium restaurant aesthetic
- Sketched the layout structure of each page before writing any code
- Decided on the technology stack (HTML5, CSS3, vanilla JavaScript) to keep the project lightweight and dependency-free

HTML Development:

- Wrote semantic HTML5 markup for all four pages: home.html, menu.html, about.html, and contact.html
- Structured the navigation bar using an HTML table element for consistent vertical alignment across all pages
- Created the hero section with a div-based content area using class-based targeting for CSS styling
- Built the food menu structure with category headings and individual food card divs for each of the 15 menu items

- Developed the About page with six structured about-box sections covering restaurant history, mission, vision, values, chef profiles, and highlights
- Designed the Contact page with three contact-box sections for contact details, working hours, and the contact form
- Embedded SVG icons inside the scroll-to-top button for the upward arrow graphic

CSS Styling:

- Created a single external style.css file providing uniform styling across all four pages
- Applied CSS linear-gradient overlays on background images for the About, Contact, and Menu pages to improve text readability
- Used CSS Flexbox for the hero section layout and for centering elements within the scroll-to-top button
- Implemented CSS Grid (grid-template-columns: repeat(3, 1fr)) for the food card layout on the menu page
- Wrote CSS media queries at breakpoints of 1100px and 700px to create a responsive layout for all screen sizes
- Styled all interactive elements (buttons, cards, list items) with CSS hover transitions including scale, translateY, and colour changes
- Designed the scroll-to-top button with position: fixed, CSS opacity/visibility transitions, and boxshadow for a glowing effect

JavaScript Development:

- Wrote the Menu() function to redirect users from the Home page to the menu page using window.location.href
- Implemented the addCart() function to display an order confirmation alert when the 'Order Now' button is clicked
- Developed the favourite(food) function to accept the food category as a parameter and display an addtofavourites alert
- Coded the Submit() function for contact form validation, checking Name and Email fields and using confirm() and alert() dialogs
- Implemented the callRestaurant() function to display the restaurant phone number on button click
- Created the showTime() function using the Date object and toLocaleTimeString(), called every second via setInterval() to display a live clock
- Implemented the back-to-top scroll logic using window.addEventListener('scroll') and element.classList.add/remove() on all four pages

Testing and Quality Assurance:

- Tested all interactive JavaScript functions across Google Chrome, Mozilla Firefox, and Microsoft Edge
- Verified responsive layout at multiple screen widths using browser developer tools
- Checked all navigation links across all four pages to ensure correct routing
- Validated contact form behaviour with both empty and filled inputs
- Inspected all food card images, prices, and button functionality on the menu page

6. Skills Acquired

Technical Skills:

- HTML5 semantic structure, forms, tables, and embedded SVG
- CSS3 Flexbox, Grid, transitions, animations, pseudo-elements, and media queries
- JavaScript DOM manipulation, event listeners, setInterval(), and window methods
- Responsive web design techniques for desktop, tablet, and mobile
- External CSS file management and consistent design theming across multiple pages

Soft Skills:

- UI layout planning from scratch without design tools
- Project planning and time management within a two-week deadline
- Attention to detail in visual consistency and spacing
- Debugging and cross-browser compatibility testing

7. Challenges Faced & Solutions

Challenge 1: Responsive Menu Grid on Small Screens

The menu page initially used a fixed three-column grid layout, which caused the food cards to overflow and become unreadable on smaller screens such as tablets and mobile devices.

Solution: CSS Grid media queries were implemented at two breakpoints — below 1100px, the layout switches to a two-column grid, and below 700px, it collapses to a single-column layout. This ensured all food cards remained fully readable and properly spaced on every device size.

Challenge 2: Contact Form Submission Without a Backend

The contact form required a way to validate user inputs and provide submission feedback without any server-side processing or email service integration.

Solution: Client-side JavaScript validation was implemented in the Submit() function. The function checks whether the Name and Email fields are empty and alerts the user if they are. If both fields are filled, a confirm() dialog confirms the user's intent, followed by a success alert. This simulates a functional form experience entirely within the browser.

Challenge 3: Maintaining Visual Consistency Across Four Separate Pages

With four independent HTML files, ensuring that all pages shared the same visual appearance — fonts, colours, button styles, spacing, and layout — was a challenge that could easily lead to inconsistencies. Solution: All styling was centralised in a single external CSS file (style.css) linked from every page. Reusable class names

such as .navbar, .footer, .about-box, .contact-box, and .food-card ensured that design updates made in one place were automatically reflected across all pages.

Challenge 4: Food Card Image Sizing Uniformity

Food images sourced for the menu page had varying aspect ratios and dimensions, causing the food cards to appear uneven in height and the images to look distorted when displayed side by side in the grid.

Solution: All food card images were given a fixed height of 260px using CSS (height: 260px) combined with object-fit: cover and object-position: center.

8. Conclusion

This internship helped me strengthen my front-end web development skills by working on a complete, realworld-style project. The experience of building a multi-page website — from planning the layout to writing HTML, styling with CSS, and adding interactivity with JavaScript — was immensely valuable in understanding the full workflow of front-end development.

The project presented practical challenges that required independent problem-solving, which significantly improved my ability to write clean, maintainable, and responsive code. Working within a professional environment at M Squared Software & Services Pvt. Ltd. also taught me the importance of consistency, attention to detail, and thorough testing in software development.

I am grateful to M Squared Software & Services Pvt. Ltd. for this opportunity and am confident that the skills and experience gained during this internship will serve as a strong foundation for my career in software development.
